

CAPABILITY STATEMENT

VerityATLAS

Built on evidence. Designed for operational confidence.

VerityATLAS is an evidence-led mission-assurance environment for professionally governed UAV operations. It is being developed to connect operational risk, compliance, accountable decisions and audit-ready evidence in one coherent workflow.

CURRENT STATUS

Controlled MVP evaluation. Engagement is focused on operational fit, assurance value and disciplined learning - not certification, regulatory approval or live operational deployment.

The operational challenge

Professional UAV teams often manage plans, risks, approvals, evidence and learning across disconnected tools, messages and documents. This makes it harder to demonstrate why a mission was properly prepared, reviewed and authorised, and to reconstruct the evidence afterwards.

How VerityATLAS may add value

CONTROLLED MVP ALIGNMENT	DESIGN-PARTNER VALIDATION	FUTURE DIRECTION
- Governed mission-planning context and review readiness. - Operating-constraint visibility and structured risk review. - Mission Evidence Ledger for evidence continuity. - Accountable oversight, actions and governance boundaries.	- Organisation-specific roles, approvals and handovers. - Workflow fit across enterprise, infrastructure and public-safety settings. - Measures for assurance value, effort reduction and disciplined learning. - Appropriate connections to existing systems and evidence sources.	- Live operational data integrations and richer monitoring. - Broader system interoperability and automated evidence exchange. - AI-assisted analysis that supports review without creating false authority. - Capabilities remain subject to governance, validation and controlled development.

Design-partner proposition

VerityAir is seeking a small number of informed organisations to test representative workflows, challenge assumptions and define measurable evaluation criteria. Engagement can begin digitally with the Operational Fit Review, followed by a focused 30-minute discussion and a bounded, non-operational workflow review.
